Your Name & Assistant — August 5, 2026

You • 10:32

Hi! This is a short test message.

Assistant • 10:33

Hello! This is the reply, left-aligned in a grey bubble, just like Messenger.

You • 10:34

Now let me try a slightly longer message, to see how the bubble behaves when the text wraps to more than one line: it should wrap without ever breaking a word, even a long one like internationalization or otorhinolaryngologist.

Assistant • 10:35

Exactly: no word was broken with a hyphen. If a word doesn't fit in the remaining space, it's moved whole to the next line.

You • 10:36

One last test: a very long message that definitely won't fit on a single page, to see whether the bubble breaks cleanly between the current page and the next one, with rounded corners only where the message truly starts and ends, and a straight edge at the point where the page changes. I'm repeating filler text to make the message long enough to go past the bottom of the current page and continue on the next one, checking that the background color, margin indent, and alignment stay consistent even in the second part of the bubble. Adding a few more lines: test, test, test, filler text, filler text, filler text, filler text, filler text, filler text, filler text, filler text, filler text, filler text, filler text, filler text, filler text, filler text, filler text, filler text, filler text.

Assistant • 10:41

All confirmed: the template works as intended, with "auto-fit" bubbles for normal messages and "breakable" bubbles (with the asterisk) for very long ones.
